Jastipin User Guide

Jastipin is a back office system for running a *jastip* business: buying goods abroad on behalf of customers and shipping them once you return to Indonesia.

The application is used **only by your own team**. Customers never log in. They keep ordering the way they always have, through WhatsApp or social media, and an admin records those orders here.

The system exists to answer four questions that get expensive to answer by hand once you pass a few dozen orders per trip:

1. What exactly do I need to buy on this trip, and how many of each?
2. Who paid what, and who still owes me money?
3. Which goods belong to which customer, and which are spare stock?
4. Did this trip actually make money after tickets, baggage, and shipping?

This guide is organised in menu order. Read the first two chapters once, then use the rest as a reference for whichever screen you are on.

Who uses it

Role	Typical person	What they do here
Owner	Business owner	Everything, plus profit reports, store settings, and user management
Admin	Daily operator	Trips, orders, invoices, shipping, stock, receivables
Trippler	The person travelling	Opens the shopping list and records purchases from the store

Give the tripper their own account. They will use the app on a phone while standing in a shop in Tokyo, and they only need two screens.

The complete cycle

Every feature in this application sits somewhere on this line. Read it once and the rest of the manual will make sense.

Key concepts

Five ideas drive almost every rule in the system. They are worth understanding before you use the app, because they explain why certain things are allowed and others are refused.

The exchange rate is locked per trip. Every price on a trip is converted using the one rate set when the trip was created. **Ambil kurs terkini** on the trip form fetches today's rate from a public exchange-rate service so nobody has to copy it out of another app — but the moment the trip is saved, that number is frozen. If the market rate moves after the trip closes, your reported profit does not move with it.

Prices are snapshots, not links. When you add a product to a trip catalog, the selling price is calculated once and stored. When a customer orders it, that price is copied again into the order. Editing the product master later never changes an order that already exists.

Cost of goods comes from real purchases. Profit is not calculated from the estimated cost you entered when the order was created. It comes from what the tripper actually paid at the till.

Surplus becomes an asset, not an expense. If the tripper buys 8 units when only 5 were ordered, the extra 3 go into stock. Their cost is *not* charged against the trip's profit. The money left your pocket, but the value is still sitting in your warehouse as goods. It becomes a cost later, when that stock sells.

Couriers charge for space, not just weight. A big light box costs more to ship than the scale suggests, because the courier bills whichever is greater: the actual weight or the volumetric weight derived from the box dimensions. The app calculates both, so record the dimensions when you pack.

Getting Started

Signing in

Open the application URL and enter the email and password your owner gave you.

There is no self-registration and no password reset by email. If you forget your password, an owner resets it for you from **Pengaturan** → **Pengguna**.

Sessions last seven days. You stay logged in across browser restarts. Clicking **Keluar** in the bottom-left asks for confirmation before signing you out.

The navigation map

The sidebar is grouped by *when* you use each screen during a trip, not alphabetically. Each group is a single row that expands in place when pressed; opening one collapses the previous, so the list never grows back to full length. Only **Dashboard** is a direct link, since collapsing a single item would be a click that hides nothing.

The group holding the page you are on **expands automatically**, so arriving anywhere shows you where you are. While collapsed, the group row prints the active screen's name underneath its title instead.

Dashboard		← start here every morning
Perjalanan	>	
Penjualan	✓	← open: holds the current page
Order		
Invoice		
Pengiriman		
Siap Kemas		
Data Master	>	
Lainnya	>	
Owner Jastipin		
[Keluar]		← sign out, asks to confirm

Group	Menu item	English	Used when
Ringkasan	Dashboard	Dashboard	Every morning, to see what needs attention
Perjalanan	Trip	Trips	Planning a trip, setting up the catalog
Perjalanan	Daftar Belanja	Shopping List	Standing in the shop, buying
Perjalanan	Pembelian	Purchases	Reviewing what was bought and where it went
Penjualan	Order	Orders	Recording and managing customer orders
Penjualan	Invoice	Invoices	Billing customers
Penjualan	Pengiriman	Shipments	Entering tracking numbers
Penjualan	Siap Kemas	Packing Queue	Working through the warehouse backlog
Data Master	Customer	Customers	Adding a new buyer
Data Master	Produk	Products	Maintaining the product catalog
Data Master	Stok	Stock	Managing spare goods for marketplace sale
Lainnya	Laporan	Reports	Chasing debts, reviewing margins, channels, customers
Lainnya	Pengaturan	Settings	Store identity, message templates, shipping rates, users

Who can see what

Menu items you have no access to are hidden, not greyed out.

Screen	Owner	Admin	Tripper
Dashboard	✓	✓	✓
Trips (view)	✓	✓	✓
Trips (create, edit, catalog)	✓	✓	—
Shopping List	✓	✓	✓
Record purchase	✓	✓	✓
Delete purchase	✓	✓	—
Orders	✓	✓	—
Invoices	✓	✓	—
Shipments and packing	✓	✓	—
Customers	✓	✓	—
Products (view)	✓	✓	✓
Products (edit)	✓	✓	—
Stock	✓	✓	—
Reports: receivables, product performance, per customer, per channel	✓	✓	—
Reports: trip profit, order profit	✓	—	—
Shipping rates (view and estimate)	✓	✓	—
Shipping rates (add, delete)	✓	—	—
Settings (all tabs)	✓	—	—

Profit reports are deliberately owner-only. An admin can see what customers owe, because they need that to chase payments, but not your margins. The **Profit per Order** tab inside Laporan is hidden entirely from admins rather than shown and then refused.

Dashboard

The landing page after login. It answers “what needs my attention today”.

The top row

Four counters that should normally be small numbers.

Card	Indonesian label	What it counts
Active trips	Trip aktif	Trips that are open, closed, shopping, in transit, or arrived
Open orders	Order berjalan	Orders not yet completed or cancelled
Ready to ship	Siap dikirim	Orders fully paid but with no tracking number yet
Outstanding	Piutang berjalan	Total money customers still owe you

Ready to ship turns amber when it is above zero. That is the queue costing you goodwill: the customer has paid and is waiting.

The money row

Card	What it shows
Revenue this month	Sum of all non-cancelled, non-draft orders dated this month
Gross profit this month	Revenue minus the real cost of goods already purchased
Stock value	Quantity on hand × moving average cost, across all products

Gross profit here excludes trip expenses. For the full picture of a single trip, open that trip’s **Profit** tab.

The panels

Order terbaru lists the eight most recent orders with their status. Click an order number to open it.

Trip mendatang lists trips currently open for orders, soonest departure first.

Produk terlaris ranks products by units sold, with revenue, cost, and profit per product. Negative profit here usually means a purchase price rose after you published the selling price.

Trips

A trip is one journey abroad. It owns a catalog, a set of orders, a shopping list, expenses, and a profit report.

Creating a trip

Trip → **Buat Trip**

Field	Indonesian	Required	Notes
Title	Judul trip	Yes	Free text, e.g. “Jastip Tokyo March 2026”
Country	Negara	Yes	
City	Kota	No	
Departure date	Tanggal berangkat	Yes	
Return date	Tanggal pulang	Yes	Cannot be earlier than departure
Order deadline	Batas terima order	No	Leave empty for no cut-off
Currency	Mata uang	Yes	3-letter code, e.g. JPY, KRW, SGD
Exchange rate	Kurs ke Rupiah	Yes	How many rupiah per 1 unit of the currency
Notes	Catatan	No	Shops to visit, baggage limits

The exchange rate is the single most important field. Get it wrong and every price on the trip is wrong. Use a rate slightly worse than the market rate to give yourself a buffer.

New trips start as **Draft**. They accept no orders until you open them.

Trip lifecycle

Status	Indonesian	Meaning	Orders accepted?
<code>draft</code>	Draft	Still being set up	No
<code>open</code>	Buka Order	Published, taking orders	Yes
<code>closed</code>	Order Ditutup	Cut-off passed	No
<code>shopping</code>	Sedang Belanja	Trippler is buying abroad	Yes
<code>in_transit</code>	Perjalanan Pulang	Flying home	No
<code>arrived</code>	Tiba di Indonesia	Goods landed	No
<code>settled</code>	Selesai Dibukukan	Trip closed and booked	No
<code>cancelled</code>	Batal	Abandoned	No

Orders are still accepted while the trip is `shopping`. That is deliberate. In practice customers keep asking for one more item while the tripper is already standing in the shop, and refusing those orders would cost you sales.

Status changes have side effects

Every trip status button opens a confirmation box describing the effect. Two of them move many orders at once, which is exactly why they are worth a moment's pause. **Settled** is coloured red: there is no status after it.

Moving a trip forward drags its orders along, so you do not have to update dozens of orders one by one.

Trip moves to	Effect on orders
shopping	Orders with status <code>dp_paid</code> become <code>purchasing</code>
arrived	Orders with status <code>purchasing</code> become <code>arrived</code>

Trip detail: five tabs

Opening a trip gives you five tabs. They map to five different jobs.

Katalog	Order	Belanja	Biaya	Profit
set up prices	see who ordered	buy in store	record costs	did it pay off

Tab 1 — Katalog (Catalog)

The list of products offered on this trip, each with its own cost and markup.

HOW THE SELLING PRICE IS CALCULATED

Two markup types are available.

Type	Indonesian	Formula	Use when
Percent	Persen (%)	$\text{cost} \times (1 + \text{value} / 100)$	Normal goods, margin scales with price
Nominal	Nominal (Rp)	$\text{cost} + \text{value}$	Cheap items where a percentage is too small

WORKED EXAMPLES

Cost	Rate	Markup	Cost in Rp	Raw price	Published
¥880	108.5	35%	Rp95,480	Rp128,898	Rp128,900
¥780	108.5	+Rp40,000	Rp84,630	Rp124,630	Rp124,700
¥1,000	100	30%	Rp100,000	Rp130,000	Rp130,000

Rounding is always upward to the nearest hundred rupiah. A published price of Rp128,898 looks careless in a social media post; Rp128,900 does not.

CATALOG FIELDS

Field	Indonesian	Notes
Product	Produk	Only products not already in this catalog appear
Cost price	Harga modal	In the trip currency, not rupiah
Markup type	Jenis markup	Percent or nominal
Markup value	Markup	Pre-filled from the product master, editable
Quota	Batas kuota	Optional cap on total units across all orders
Active	Aktif	Uncheck to hide from new orders without deleting

A live preview under the form shows the resulting cost in rupiah, the selling price, and the margin per unit before you save.

RECALCULATING PRICES

Hitung Ulang Harga recomputes every catalog price using the trip's current exchange rate.

This is a deliberate, manual action. Editing the trip's exchange rate does **not** silently reprice a catalog you have already published to customers. Changing prices people have already seen is a business decision, not a side effect of fixing a typo.

REMOVING A CATALOG ITEM

A product that customers have already ordered cannot be removed. Uncheck **Aktif** instead. This keeps the order history intact.

Tab 2 — Order

Every order placed on this trip, with quantity, total, outstanding balance, and status. **Catat Order** opens the order form with this trip pre-selected.

Full detail on orders is in the [Orders](#) chapter.

Tab 3 — Belanja (Shopping)

The tripper's working screen. Covered in full in the [Shopping List](#) chapter, because it also has its own top-level menu item.

Tab 4 — Biaya (Expenses)

Trip costs that are not the price of goods. These are subtracted from gross profit to give net profit.

Category	Indonesian	Examples
Airfare	Tiket	Flights, seat selection
Baggage	Bagasi	Extra baggage allowance, overweight fees
Accommodation	Akomodasi	Hotel, hostel
Local transport	Transport	Trains, taxis, airport transfer
Visa	Visa	Visa fees, travel insurance
Other	Lainnya	SIM card, packing materials

Each entry takes a date, description, amount, and an optional receipt URL. The running total sits above the table.

Record these as you go. An expense you forget to enter makes the trip look more profitable than it was, which quietly leads to underpricing the next one.

Tab 5 — Profit

The financial report for the trip.

THE CALCULATION

Revenue	all non-cancelled, non-draft order totals
–	
Cost of goods	real purchase cost allocated to those orders
= Gross profit	
–	
Trip expenses	tickets, baggage, accommodation, transport
= NET PROFIT	

WHAT EACH FIGURE MEANS

Figure	Indonesian	Definition
Revenue	Omzet	Sum of order totals, excluding cancelled and draft
Cost of goods	HPP barang pesanan	Real purchase cost allocated to ordered items
Gross profit	Laba kotor	Revenue – cost of goods
Trip expenses	Biaya perjalanan	Total from the Biaya tab
Net profit	Laba bersih	Gross profit – trip expenses
Margin	Margin	Net profit ÷ revenue × 100

CASH FLOW FIGURES

Figure	Indonesian	Definition
Total capital out	Total modal keluar	All purchases (including surplus) + trip expenses
Payment received	Uang masuk dari customer	Total actually collected
Outstanding	Sisa tagihan belum masuk	Still owed by customers
Shipping billed	Ongkir ditagihkan	Shipping charged to customers
Shipping paid	Ongkir dibayar ke kurir	Shipping actually paid to JNE

Note the difference between **cost of goods** and **total capital out**. Capital out includes surplus stock; cost of goods does not.

WHY SURPLUS STOCK IS EXCLUDED

If the panel shows surplus stock, read it carefully. This is the single most misunderstood number in the system.

Suppose you bought 8 units at Rp100,000 each but only 5 were ordered:

```

8 units bought × Rp100,000 = Rp800,000 left your pocket
├── 5 units → customer orders → Rp500,000 counted as COST
└── 3 units → warehouse stock → Rp300,000 counted as ASSET
                                (not a cost, yet)

```

The Rp300,000 appears in **total capital out**, because the cash really did leave. It does not appear in **cost of goods**, because you still own the goods. It becomes a cost the day that stock sells on a marketplace.

Without this rule, a trip where you stocked up aggressively would look like a loss even though the business is fine.

Shopping List

Daftar Belanja — the screen the tripper uses while shopping.

Pick a trip from the dropdown at the top right. The system pre-selects the trip that is currently open or in progress, so a tripper usually does not have to choose anything.

Where the list comes from

The shopping list is **not** a table someone maintains. It is calculated live from every order on the trip, every time you open the screen.

The consequence matters in practice: if an admin in Jakarta edits an order while the tripper is in a shop in Tokyo, the tripper's list updates on the next refresh. There is no separate list to keep in sync.

ONLY DEPOSITS COUNT TOWARDS THE BUY

Ordered counts only orders whose deposit has been verified — status `Diproses` and beyond. Everything still waiting for its deposit is counted separately under **Menunggu DP** and is deliberately *not* included in what the tripper should buy.

The reason is money, not tidiness. Buying against an order whose deposit has not arrived means fronting the purchase with the shop's own cash, and if that customer walks away the goods sit in stock unpaid for. The awaiting column is still shown so the tripper can see demand building up and judge whether to chase the deposit before leaving the shop.

A banner appears above the list whenever anything is waiting, so a shrinking number is never mistaken for a shrinking order book.

Cancelled and draft orders are excluded entirely.

The four summary cards

Card	Indonesian	Meaning
Total ordered	Total dipesan	Units customers asked for
Already bought	Sudah dibeli	Units recorded as purchased
Remaining	Sisa belanja	Still to buy
Estimated capital	Perkiraan modal	Expected total cost in rupiah

Rows where nothing remains are dimmed and marked **Lengkap** (complete).

Recording a purchase

Press **Catat Beli** on a row.

Field	Indonesian	Notes
Quantity	Jumlah dibeli	Defaults to the remaining quantity
Unit price	Harga satuan	In trip currency, what you actually paid
Purchase date	Tanggal beli	Defaults to today
Custom rate	Kurs khusus	Optional; leave empty to use the trip rate
Store	Toko	Where you bought it
Notes	Catatan	Variant, promo, anything worth remembering

Enter the price you actually paid, including any discount you got. This is what makes the profit report honest.

The **custom rate** field exists because a long trip can span several days of moving exchange rates. Each purchase keeps the rate that applied when it happened.

What happens on save

The system allocates the units automatically. Orders are filled oldest first, so the customer who ordered earliest is served first when supply is tight.

A confirmation message tells you the split, for example “5 units for orders, 3 units into stock”.

If you buy fewer units than were ordered, the earliest orders are filled and the rest stay pending. Their fulfilment status becomes **Sebagian** (partial).

Purchases

Pembelian — the audit trail of everything bought, across all trips.

Filter by trip or search by product or store name. Each row shows quantity, unit cost in both currencies, and the total in rupiah.

Two badges show where the units went:

Badge	Meaning
<i>N</i> pesanan	<i>N</i> units allocated to customer orders
<i>N</i> stok	<i>N</i> units that became warehouse stock

Expand a row with the arrow on the left to see exactly which order and customer received each unit.

Deleting a purchase

Deleting reverses everything the purchase caused:

- Allocations to orders are released
- Stock that was added is pulled back out
- The purchased quantity on affected order items is recalculated

If the surplus stock has already been sold, the reversal will fail because the stock is no longer there to remove. Correct it with a stock adjustment instead.

Orders

Order — the heart of the system.

Order list

Search by order number, customer name, recipient, or phone. Filter by trip, status, sales channel, or **Belum lunas** (not fully paid).

Outstanding balances are shown in amber so unpaid orders stand out.

The **Channel** column shows where each order came in from, colour-coded so a glance down the list tells you which channel is busiest.

VIEWING TOTALS IN THE TRIP CURRENCY

Tick **Mata uang trip** and every money column switches from rupiah to the currency of that order's trip, converted at the exchange rate locked when the trip was created.

Orders from different trips convert at their own rates, so a list mixing a Japan trip and a Korea trip shows JPY on some rows and KRW on others. Nothing is recalculated in the database; this is a display toggle only, and orders on an IDR trip stay in rupiah.

Use it when you are reconciling against receipts from the shop abroad, where every figure is in the local currency.

Creating an order

Catat Order opens a three-part form.

PART 1 — TRIP AND CUSTOMER

Pick the trip first. The product picker is empty until you do, because prices come from that trip's catalog.

Changing the trip clears any items you already selected, since the prices would no longer apply.

Asal order records which channel the order arrived through. It defaults to WhatsApp because that is where most jastip orders come from, and it feeds the Per Channel report.

Value	Indonesian	Use for
whatsapp	WhatsApp	Direct chat, broadcast lists, groups
instagram	Instagram	Story replies, DMs, comments
tiktok	TikTok	Comments and DMs from videos or lives
marketplace	Marketplace	Shopee, Tokopedia, and similar
lainnya	Lainnya	Anything else: walk-ins, referrals, phone calls

Pick it as you type the order. Reconstructing where an order came from a week later is guesswork, and guesswork makes the channel report worthless.

It can be corrected later from **Ubah Order** if you picked the wrong one.

PART 2 — PRODUCTS

Choose from the trip catalog. Each addition brings its catalog price, which you may override per order for a special discount.

Selecting the same product twice increases its quantity instead of creating a duplicate line.

If a product has a quota and your quantity would exceed it, a warning appears under the line and the server will reject the order on save.

PART 3 — SHIPPING ADDRESS

By default the order ships to the customer's saved address, shown for confirmation.

Tick **Kirim ke alamat lain** to send it elsewhere: a gift, an office, a friend's house. The customer's address is copied in as a starting point so you only change what differs.

The address is **copied into the order**, not linked. If the customer moves next year, this order still shows where the goods actually went.

THE SUMMARY PANEL

Field	Indonesian	Notes
Discount	Diskon	Cannot exceed the subtotal
Shipping fee	Ongkir ditagihkan	What you charge the customer
Deposit required	DP diminta	Leave empty for the 50% default
Notes	Catatan	Special requests

Subtotal	sum of quantity × unit price
- Discount	
+ Shipping fee	
= TOTAL	
- Paid amount	
= BALANCE DUE	

Order lifecycle

A newly recorded order starts at **awaiting_dp**, not **draft** — recording it in the back office *is* the confirmation, and the very next thing you do is ask for the deposit. **draft** still exists for orders parked mid-entry.

Status	Indonesian	Meaning
<code>draft</code>	Draft	Parked mid-entry, not yet confirmed
<code>awaiting_dp</code>	Menunggu DP	Confirmed, waiting for the deposit — where new orders start
<code>dp_paid</code>	Diproses	Deposit received and verified; the order now counts towards the shopping list
<code>purchasing</code>	Dibelian	Trippler is buying the goods
<code>arrived</code>	Barang Tiba	Goods received and matched
<code>packed</code>	Sudah Dikemas	Packed under the customer's name
<code>invoiced</code>	Ditagihkan	Final invoice sent
<code>paid</code>	Lunas	Fully paid, ready to ship
<code>shipped</code>	Dikirim	Handed to the courier, tracking recorded
<code>completed</code>	Selesai	Confirmed received by the customer
<code>cancelled</code>	Batal	Cancelled

Every status button opens a confirmation box first, stating what the move does rather than merely asking whether you are sure. Status changes have no undo, and several of them lock the order, so the box is there to be read — the move to `shipped` is coloured red for that reason.

Two transitions are guarded by money, not by a button:

- You cannot move to `dp_paid` until deposits actually recorded reach the required amount.
- You cannot move to `paid` while any balance is outstanding.

Editing order items

This is the most frequently used action in daily operation. A customer messages “can you make that two instead of one” and you change it here.

Each line can be edited in place with the pencil icon.

THE RULES

Rule	Why
Cannot edit at all once the order is <code>shipped</code> , <code>completed</code> , or <code>cancelled</code>	The package is gone; documents must match reality
Quantity cannot go below the quantity already received	You cannot un-receive goods that are in your warehouse
Reducing below the quantity already purchased releases the excess into stock	The goods physically exist; they must not vanish from the books
An order must keep at least one item	Cancel the order instead
Discount cannot exceed the subtotal	Prevents a negative total

WHAT HAPPENS AUTOMATICALLY

You change quantity from 3 to 2

- └─> Line subtotal recalculated
- └─> Order subtotal and total recalculated
- └─> Balance due recalculated
- └─> 1 surplus unit released from this order into stock
- └─> Status stepped back if the order was paid but now owes money
- └─> Entry written to the audit trail

That fifth step matters. If an order was fully paid and you *add* items, the status drops from `paid` back to `invoiced` so the new balance is visible instead of hiding behind a green “paid” badge.

Payments

The **Pembayaran** panel shows deposit required, amount paid, and balance due, followed by every payment recorded.

Type	Indonesian	Effect on balance
Deposit	DP	Increases paid amount
Settlement	Pelunasan	Increases paid amount
Refund	Refund	Decreases paid amount
Adjustment	Penyesuaian	Increases paid amount

Methods available: bank transfer, cash, QRIS, e-wallet, other.

RECORDING A PAYMENT

Catat Bayar pre-fills the amount with whatever is outstanding: the remaining deposit if the deposit is not yet complete, otherwise the full balance.

Optional fields: reference (transfer ID or sender name), proof of transfer, payment date, and notes.

Bukti transfer uploads the customer's transfer receipt — a photo or a PDF — to the shop's own server; JPG, PNG, WEBP, and PDF are accepted. Images show a thumbnail so you can confirm you attached the right screenshot before saving, and the file stays openable from the payment list afterwards for reconciling against the bank statement.

The file type is detected from the file's own contents rather than its name, and it is stored under a fresh random filename, so a misnamed or hostile upload cannot decide where it lands on disk.

AUTOMATIC STATUS CHANGES

Condition after payment	Order becomes
Deposit reaches the required amount, order was <code>awaiting_dp</code>	<code>dp_paid</code>
Balance reaches zero	<code>paid</code>

A refund larger than the amount received is rejected.

REQUESTING A DEPOSIT

While a deposit is outstanding, a **Tagih DP** button appears. It opens a ready-to-send WhatsApp message built from your template, with the customer name, trip, total, deposit amount, and bank account already filled in.

Receiving goods

Cocokkan Barang opens the matching screen. It is available while the order is `dp_paid`, `pur-chasing`, or `arrived`.

Every line defaults to fully received, because that is the normal case. Change only the lines with a problem.

Received quantity	Fulfilment status becomes
Equal to ordered	Sudah Dibeli (purchased)
Between 1 and ordered	Sebagian (partial)
Zero	Tidak Ada (unavailable)

Saving moves the order to `arrived`.

Items marked unavailable still appear on the invoice, labelled as such, so the customer understands why the total differs from the original order.

Cancelling an order

Batalkan asks for an optional reason and warns you what will happen:

- Goods already bought for this order are released into stock
- Money already received must be returned by recording a **refund**

Cancelling does not automatically refund. That is a separate, deliberate action, because the money has to physically leave your bank account too.

Invoices

Invoice — billing documents sent to customers.

Two kinds

Type	Indonesian	Bills for	Issue when
Deposit	DP	Only the deposit amount	Order is confirmed
Final	Pelunasan	Full order value minus payments received	Goods have arrived

Most businesses only issue final invoices and request the deposit through a WhatsApp message. Both are supported.

Issuing an invoice

From the order detail page, **Invoice** → **Terbitkan**.

Choose the type, optionally set a due date (otherwise the default from Settings applies), and add a note.

Every amount is **copied into the invoice** at the moment it is issued. Editing the order afterwards does not alter an invoice the customer has already seen. If the order really changed, void the old invoice and issue a new one.

Issuing a final invoice moves the order to `invoiced`.

The PDF

Every invoice renders as a PDF containing:

- Your store name, address, phone, and email from Settings
- Invoice number, issue date, due date
- Billing details and shipping address
- Line items with quantity, unit price, and subtotal
- Totals, amount paid, and balance due
- Payment history
- Bank account details, if a balance is outstanding

- Your closing note

Open it with the **PDF** button. It renders on first request and is cached afterwards.

Sending to the customer

Kirim opens a dialog with the full message text and two buttons.

You press send yourself, from your own number. There is no paid gateway and no unfamiliar sender ID, so customers see a message from a contact they recognise.

Once you open WhatsApp, the invoice is marked as sent and the channel is recorded.

Invoice statuses

Status	Indonesian	Meaning
<code>draft</code>	Draft	Created, not yet sent
<code>sent</code>	Terkirim	Delivered to the customer
<code>paid</code>	Lunas	Fully paid
<code>void</code>	Dibatalkan	Cancelled, replaced by another invoice

A paid invoice cannot be voided. The money has already been recorded.

Voiding an invoice

Batalkan — the red ban icon on the invoice list, or the **Batalkan** button in the order's invoice panel. It appears only for invoices that are neither paid nor already void.

Use it when an invoice was issued with the wrong figures: the customer added an item after you billed them, or a quantity was corrected. Do not delete and re-issue silently — the customer may already be holding the old PDF, and the audit trail should show that it was withdrawn.

Voiding is deliberately narrow in effect:

What happens	What does not
Status becomes <code>void</code>	Payments already recorded are untouched
The invoice stops counting as an outstanding bill	The order status stays where it is
The PDF stays downloadable as a record	Nothing is deleted

Because the order status does not move, a replacement invoice can be issued straight away from the same panel.

A confirmation box states all of this before the action runs.

The invoice list

Search by invoice number, order number, or customer. Filter by status or type. Invoices past their due date and still unpaid are flagged **lewat tempo** (overdue).

Shipments

Pengiriman — packages and their JNE tracking numbers.

Step 1 — Pack

From the order, **Tandai Dikemas**.

Field	Indonesian	Notes
Courier	Kurir	Defaults to JNE
Service	Layanan	REG, YES, OKE, or JTR
Weight	Berat	In grams, as weighed on the scale
Dimensions	Dimensi paket	Length × width × height in cm; optional
Notes	Catatan kemasan	Bubble wrap, fragile, do not stack

The order moves to packed.

ESTIMATING THE SHIPPING COST

Hitung Ongkir works out what the courier will charge, using the destination city already on the order — you do not retype the address.

Couriers bill on whichever is greater: actual weight or **volumetric weight**, a stand-in for the space the box occupies in the truck.

$$\text{volumetric kg} = \frac{\text{length} \times \text{width} \times \text{height (cm)}}{\text{divisor}}$$

$$\begin{aligned} \text{chargeable kg} &= \max(\text{actual kg}, \text{volumetric kg}), \text{ rounded UP to a whole kg} \\ \text{cost} &= \text{chargeable kg} \times \text{rate per kg for the destination city} \end{aligned}$$

The divisor is 6000 by default, which is what JNE uses. Change it under Settings → Ongkir if your courier uses 5000.

Worked example. A box of instant noodles: 40 × 30 × 25 cm, weighing 800 g.

```

volumetric = (40 × 30 × 25) ÷ 6000 = 30000 ÷ 6000 = 5 kg
actual      = 0.8 kg
chargeable  = max(0.8, 5)           = 5 kg
cost        = 5 × Rp28.000 (Bandung, YES) = Rp140.000

```

Weighing alone would have suggested 1 kg and Rp28.000 — a Rp112.000 shortfall absorbed out of your margin. This is the single most common way jastip shipping costs go wrong.

The reverse case: 2.3 kg of skincare in a small box rounds **up** to 3 kg, because couriers do not sell fractions of a kilogram.

The result panel shows both weights, which one was charged, and the rate used. If the destination city has no rate on file it says so and falls back to the default rate — the number is still usable, just less precise.

Pressing **Simpan** stores the dimensions and the estimate on the shipment, so the figure is there later when you enter the real cost.

Step 2 — Enter the tracking number

Input Resi & Kirim.

Field	Indonesian	Notes
Tracking number	Nomor resi	Required, stored uppercase
Shipping cost	Ongkir dibayar	What you paid JNE, not what you charged
Ship date	Tanggal kirim	Defaults to today

If you estimated the cost at packing time, a **Pakai estimasi** link under the cost field fills it in. Replace it with the real figure from the receipt when it differs — the estimate is a starting point, not the record.

Keep the two shipping figures separate. The customer-facing fee is on the order; the amount you paid the courier is here. The difference is real margin, and the Profit tab reports both.

THE UNPAID GUARD

An order with an outstanding balance is refused, with the exact amount shown.

To override, tick **Kirim walau belum lunas**. Use it only for regulars you trust to pay on delivery. The override is recorded in the audit trail.

Shipping freezes the order: its items can no longer be edited.

Step 3 — Notify the customer

Kabari Customer builds a WhatsApp message containing the courier, service, and tracking number, plus the JNE tracking link. Same flow as invoices: you press send.

The shipment records when the customer was notified. The shipment list flags packages that were shipped but never announced, so nobody is left wondering where their parcel is.

THE COST COLUMN ON THE SHIPMENT LIST

The **Pengiriman** list shows the cost actually paid. Packages not yet handed to the courier show the estimate instead, labelled *estimasi*, so it is never mistaken for a final figure when totalling costs.

Step 4 — Close it out

Tandai Diterima sets the shipment to delivered and the order to `completed`.

Shipment statuses

Status	Indonesian	Meaning
<code>packing</code>	Dikemas	Being packed
<code>ready</code>	Siap Kirim	Packed, waiting for a tracking number
<code>shipped</code>	Dikirim	Handed to the courier
<code>delivered</code>	Diterima	Confirmed received
<code>returned</code>	Retur	Came back undelivered

A shipment cannot be marked shipped without a tracking number. The database itself enforces this, so a customer is never notified about an empty tracking number.

Packing Queue

Siap Kemas — the warehouse worklist.

It answers one question: what do I need to handle today? Switch between four stages with the dropdown.

Stage	Indonesian	What to do next
arrived	Siap dikemas	Goods matched, pack them per customer
packed	Sudah dikemas	Issue the final invoice
invoiced	Menunggu pelunasan	Wait for or chase the payment
paid	Siap dikirim	Enter the JNE tracking number

Each row shows the recipient, destination, item count, and outstanding balance. **Proses** jumps to the order.

Filter by trip when a shipment lands and you want to clear that trip’s backlog in one pass.

Customers

Customer — the people who order from you.

Fields

Field	Indonesian	Required	Notes
Name	Nama	Yes	
WhatsApp number	Nomor WhatsApp	Yes	Any common format accepted
Email	Email	No	Enables the email option on messages
Instagram	Instagram	No	
Address	Alamat	No	Street, number, RT/RW, district
City	Kota	No	
Province	Provinsi	No	
Postal code	Kode Pos	No	
Notes	Catatan	No	Packing preferences, landmarks

A customer code (CUS-0001) is assigned automatically.

The phone number is the identity

One number, one customer. The same number in any format is refused on save.

This is deliberate: sales-per-customer reporting is grouped by WhatsApp number. If one person gets recorded twice under slightly different names, their spending splits across two rows and nobody shows up as the big buyer they actually are.

Phone number handling

Numbers are normalised to international format so WhatsApp links always work.

You type	Stored as
081234567890	6281234567890
0812-3456-7890	6281234567890
+62 812 3456 7890	6281234567890
(0812) 3456-7890	6281234567890
81234567890	6281234567890
+81 90 1234 5678	819012345678

A leading or means the number already carries a country code, so it is left alone. Without that marker, a number starting with is treated as Indonesian.

Fill in the address. An order cannot be created without a shipping address, and having it on the customer saves retyping it every time.

Price history across trips

The clock icon on each product row opens its price history: what the product cost on every trip it has appeared in, in that trip's own currency and at that trip's locked exchange rate.

Column	Meaning
Trip	Trip code, country, departure date, and the rate that was locked
Katalog	Cost price entered when building that trip's catalog
Beli riil	Average price actually paid at the till
Harga jual	Selling price that was published to customers
Dibeli / Terjual	Units bought and units sold on that trip

Read the two cost columns together. If **Beli riil** is consistently above **Katalog**, the catalog price is being set too optimistically and the markup is quietly eating the difference.

The same figures appear as a one-line hint when you add the product to a new trip catalog, with a **Pakai harga ini** link. The link only appears when the previous trip used the **same currency** — the same brand bought in Korea instead of Japan is not a comparable number, and copying it across would be wrong by a factor of a hundred rather than a few percent.

For that same reason, choosing a product whose master currency differs from the trip's currency leaves the cost field **empty** rather than pre-filling it.

Deleting

Deleting hides the customer from lists but keeps the record, because past orders still point at it. Order history is never lost.

Products

Produk — the master catalog.

This is a reference list, not a price list. Actual selling prices live on each trip's catalog, because exchange rates and shop prices change every journey.

Fields

Field	Indonesian	Notes
Name	Nama produk	Include size or variant
SKU	SKU	Auto-generated if left empty
Category	Kategori	For filtering and reports
Brand	Brand	
Usual store	Toko langganan	Helps the tripper find it
Currency	Mata uang	Currency of the reference price
Reference cost	Harga modal	Typical purchase price abroad
Markup type	Jenis markup	Default when adding to a trip catalog
Markup value	Markup	Default markup
Weight	Berat	Grams, for shipping estimates
Image URL	URL gambar	
Notes	Catatan	
Active	Produk aktif	Inactive products cannot be added to catalogs

The reference cost and markup are **defaults**, pre-filled when you add the product to a trip. You can override both per trip.

Categories

Kategori opens a small manager for adding, renaming, and deleting categories. A category still in use by products cannot be deleted.

Deleting

Deleting deactivates the product rather than erasing it. It disappears from catalog pickers, but every past order, purchase, and report stays intact.

Stock

Stok — goods you own that nobody ordered.

Where stock comes from

Three things create stock: surplus purchases, quantity reductions on orders that were already bought for, and manual adjustments.

Moving average cost

Each product carries one average cost, recalculated every time stock arrives.

Existing:	3 units @ Rp100,000	=	Rp300,000
Incoming:	2 units @ Rp110,000	=	Rp220,000
Now:	5 units		<u>Rp520,000</u>
New average cost = $\text{Rp520,000} \div 5 = \text{Rp104,000}$ per unit			

Average cost is used rather than tracking each batch separately, because jastip goods are identical units and nobody labels which trip a bottle came from. It keeps the stock value sensible when purchase prices differ between trips.

Recording a marketplace sale

Jual on a stock row.

Field	Indonesian	Notes
Quantity sold	Jumlah terjual	Cannot exceed stock on hand
Selling price	Harga jual per pcs	
Channel	Kanal penjualan	Shopee, Tokopedia, Instagram
Notes	Catatan	

The margin per unit is shown live as you type, using the moving average cost.

Marketplace sales are recorded separately from trip profit. A trip's report covers goods that customers ordered; stock sales are a different line of business with a different margin.

Stock adjustment

Sesuaikan sets the quantity to whatever you physically counted. The difference is written to the movement history with your reason, so a shrinking stock level always has an explanation attached.

Movement history

The **Riwayat Pergerakan** tab logs every change.

Type	Indonesian	Direction
<code>in_purchase</code>	Masuk dari belanja	+
<code>out_order</code>	Dipakai pesanan	–
<code>out_marketplace</code>	Terjual marketplace	–
<code>adjustment</code>	Penyesuaian	+ or –

Reports

Laporan — up to five tabs, each exportable to CSV.

Owners see all five. Admins see everything except Order profit; that margin tab is hidden from them.

Receivables

Every order with money outstanding, oldest first.

Column	Indonesian	Notes
Order	Order	Click to open
Customer	Customer	Includes a “chase via WhatsApp” link
Total	Total	Order value
Paid	Sudah bayar	Received so far
Outstanding	Sisa	Still owed
Age	Umur	Days since the order date

Anything past 14 days is shown in red. Work this list from the top: the oldest debts are the hardest to collect.

Order profit

Margin per order. Owner only; the tab does not appear for admins.

Column	Meaning
Revenue	Order total
Cost of goods	Real purchase cost allocated to this order
Profit	Revenue – cost of goods
Margin	$\text{Profit} \div \text{revenue} \times 100$

An order showing zero cost of goods has no purchases recorded against it yet. That is a data gap, not a 100% margin.

Negative profit usually means the shop price rose after you published the selling price. Compare against the trip catalog to confirm.

Product performance

Units sold, order count, revenue, cost, and profit per product. Filter by trip.

Use it to decide what to carry next trip and where your markup is too thin.

Per Customer

One row per customer, biggest spender first. Filter by trip to see who bought on a particular run, or leave it on all trips for lifetime figures.

Column	Indonesian	Meaning
Customer	Customer	Name, code, city, and date of their last order
Orders	Order	Number of non-cancelled orders
Pieces	Pcs	Total quantity across those orders
Revenue	Omzet	Sum of order totals
Average	Rata-rata	Revenue ÷ orders
Profit	Profit	Revenue – real cost of goods
Outstanding	Piutang	Still owed across all their orders

Two ways to use it. Read from the top to decide who gets priority when a trip has limited slots or a product has a quota. Then read the Outstanding column: a customer who buys often *and* owes often is a different problem from one who simply buys a lot.

A customer with high revenue but low profit is buying your thinnest-margin products. That is worth knowing before you offer them a discount.

Per Channel

Where the orders come from, based on the **Asal order** field.

Column	Indonesian	Meaning
Channel	Channel	WhatsApp, Instagram, TikTok, Marketplace, or Lainnya
Orders	Order	Non-cancelled orders from that channel
Customers	Customer	Distinct customers who ordered through it
Revenue	Omzet	Sum of order totals
Average	Rata-rata	$\text{Revenue} \div \text{orders}$
Profit	Profit	$\text{Revenue} - \text{real cost of goods}$
Share	Porsi omzet	That channel's percentage of total revenue, drawn as a bar

The shares always add up to 100%, so the bars are directly comparable.

Read it against the effort each channel costs you. A channel with few orders but a high average order value may be worth more than a noisy one that produces small orders — the Average column tells you which is which.

Orders recorded before this field existed default to WhatsApp, so early figures lean that way until enough new orders accumulate.

CSV export

Each tab has an **Ekspor CSV** button. Files open cleanly in Excel, including accented characters in customer names.

Settings

Pengaturan — owner only for editing. Five tabs.

Toko (Store identity)

Appears on invoice PDFs and in customer messages.

Setting	Indonesian	Used in
Store name	Nama toko	Invoice header, message templates
WhatsApp number	Nomor WA toko	Invoice
Email	Email toko	Invoice
Address	Alamat toko	Invoice
Bank account	Rekening pembayaran	Invoice and every payment request
Closing note	Catatan penutup invoice	Invoice footer
Invoice due days	Jatuh tempo invoice	Default due date on new invoices

Get the bank account right. It appears on every invoice and payment request, and a typo here means money lands nowhere.

Template Pesan (Message templates)

Three editable templates. Placeholders in `{{double_braces}}` are replaced with real data when a message is built.

Template	Indonesian	Used when
Deposit request	Pesan permintaan DP	Pressing Tagih DP
Invoice	Pesan penagihan pelunasan	Sending an invoice
Shipment	Pesan informasi pengiriman	Notifying about a tracking number

AVAILABLE PLACEHOLDERS

Placeholder	Replaced with
{{customer_name}}	Customer name
{{store_name}}	Your store name
{{trip_title}}	Trip title
{{order_number}}	Order number
{{invoice_number}}	Invoice number
{{total}}	Formatted total, e.g. Rp335.000
{{dp_amount}}	Deposit required
{{amount_paid}}	Amount already paid
{{amount_due}}	Outstanding balance
{{due_date}}	Invoice due date
{{bank_account}}	Bank account from store settings
{{courier}}	Courier name
{{service}}	Service level
{{tracking_number}}	Tracking number
{{recipient_name}}	Recipient on the shipping address

An unrecognised placeholder is left in the message as-is, so a typo shows up immediately instead of silently disappearing.

Ongkir (Shipping)

Two parts: how the cost is calculated, and the rate table it is calculated against.

CALCULATION SETTINGS

Setting	Indonesian	Default	Meaning
Volumetric divisor	Pembagi berat volume	6000	Divides length × width × height in cm to give volumetric kilograms
Fallback rate	Tarif cadangan per kg	Rp25.000	Used when the destination city is not in the rate table

JNE, SiCepat, and J&T all use 6000 for domestic parcels. Some couriers and most international air freight use 5000, which makes every bulky package cost more. Change it only if your courier's terms say so.

RATE TABLE

One row per courier, service, and destination city. When you estimate a cost, the order's shipping city is matched here first; only if there is no match does the fallback rate apply.

Field	Indonesian	Notes
City	Kota tujuan	Matched case-insensitively; “Kota Bandung” and “bandung” are the same row
Province	Provinsi	Display only, to tell similarly named cities apart
Courier	Kurir	JNE by default
Service	Layanan	REG, YES, OKE, or JTR
Rate per kg	Tarif per kg	What the courier charges per kilogram
Minimum weight	Berat minimum	Usually 1000 g — couriers bill at least 1 kg
Estimated delivery	Estimasi tiba	Free text shown with the estimate, e.g. “2-3 hari”

Saving a city that already exists for the same courier and service **updates** that row rather than creating a duplicate, so keeping rates current is a matter of re-entering the city with the new price.

The system ships with rates for the cities Indonesian jastip shops send to most often. Add yours as you encounter them: an estimate against the fallback rate is a guess, one against a real rate is a number you can quote to a customer.

Editing rates is restricted to owners; admins can see them and use the estimate.

Pengguna (Users)

Add, edit, deactivate, and delete accounts, and reset passwords.

Action	Notes
Add user	Name, email, password, role
Edit user	Email cannot be changed; use deactivate and create instead
Reset password	Signs the user out of every device
Deactivate	Blocks login without deleting history
Delete	Permanent; audit trail entries survive

Two safeguards apply: you cannot delete your own account, and you cannot remove or demote the last active owner. Otherwise nobody could manage users any more.

Jejak Perubahan (Audit trail)

Who changed what, and when. Filter by entity type.

Action	Indonesian	Recorded for
<code>create</code>	Dibuat	New orders, purchases, invoices
<code>update</code>	Diubah	Order edits, settings changes
<code>item_change</code>	Ubah item	Quantity and price changes on orders
<code>status_change</code>	Ubah status	Order and trip status moves
<code>payment_record</code>	Catat pembayaran	Payments recorded
<code>delete</code>	Dihapus	Deleted payments and purchases
<code>ship</code>	Kirim	Tracking numbers entered

This is the screen to open when a total does not look right and you need to know who changed the quantity, and when.

Appendix A — Money and rounding

All amounts are stored with two decimal places and calculated using exact decimal arithmetic, never floating point. A one-rupiah drift across a hundred orders would show up in the profit report, so it is designed out.

Situation	Rule
Currency conversion	Multiply by the rate, round to whole rupiah
Published selling price	Round up to the nearest Rp100
Deposit percentage	Round to whole rupiah
Report totals	Round to whole rupiah for display

Displayed as `Rp1.250.000`, using Indonesian thousands separators.

Appendix B — Worked example, end to end

A complete trip with real numbers, so you can check the system against your own arithmetic.

Setup. Trip to Japan, rate ¥1 = Rp100.

Product	Cost	Markup	Selling price
Lotion	¥1,000	30%	Rp130,000
Snack Box	¥500	+Rp25,000	Rp75,000

Orders.

Order	Customer	Items	Total
ORD-0001	Rina	2 × Lotion, 1 × Snack Box	Rp335,000
ORD-0002	Budi	3 × Lotion	Rp390,000

Deposits. Rina pays Rp167,500 (50%). Budi pays Rp195,000 (50%).

Purchases. The tripper buys 8 Lotion at ¥1,000 and 1 Snack Box at ¥500.

8 Lotion	→	5 to orders (2 Rina + 3 Budi),	3 to stock
1 Snack	→	1 to order (Rina),	0 to stock

A change. Budi reduces his order from 3 to 2.

Effect	Result
Order total	Rp390,000 → Rp260,000
Budi's balance	Rp65,000
Stock	3 → 4 units of Lotion

Completion. Rina's order is received, packed, invoiced, paid in full, and shipped. Budi's is still outstanding.

Trip expenses. Extra baggage Rp850,000, airport train Rp150,000.

The report.

Line	Calculation	Amount
Revenue	$335,000 + 260,000$	Rp595,000
Cost of goods	$4 \text{ Lotion} \times 100,000 + 1 \text{ Snack} \times 50,000$	Rp450,000
Gross profit	$595,000 - 450,000$	Rp145,000
Trip expenses	$850,000 + 150,000$	Rp1,000,000
Net profit	$145,000 - 1,000,000$	-Rp855,000

Cash line	Calculation	Amount
Total capital out	$(8 \times 100,000) + (1 \times 50,000) + 1,000,000$	Rp1,850,000
Surplus stock	$4 \text{ units} \times \text{Rp}100,000$	Rp400,000
Outstanding	Budi's remaining balance	Rp65,000

Note that cost of goods counts 4 units of Lotion (2 for Rina, 2 for Budi), not the 8 that were bought. The other 4 sit in stock worth Rp400,000 and are not charged against this trip.

This trip lost money because Rp1,000,000 of expenses was spread over only two small orders. That is the correct conclusion: on a real trip those fixed costs are spread over far more orders.

Appendix C — Common tasks

I want to...	Go to
Start a new trip	Trip → Buat Trip
Set prices for a trip	Trip → open it → Katalog
Record an order from WhatsApp	Order → Catat Order
Ask a customer for their deposit	Order detail → Tagih DP
See what to buy abroad	Daftar Belanja
Record something I just bought	Daftar Belanja → Catat Beli
Check goods against orders	Order detail → Cocokkan Barang
Find today's packing work	Siap Kemas
Bill a customer	Order detail → Invoice → Terbitkan
Enter a JNE tracking number	Order detail → Input Resi & Kirim
Find out who owes me money	Laporan → Piutang
See if a trip made money	Trip → open it → Profit
Sell leftover goods	Stok → Jual
Change the invoice bank account	Pengaturan → Toko
Give the tripper an account	Pengaturan → Pengguna
Find out who changed an order	Pengaturan → Jejak Perubahan

Appendix D — Glossary

Indonesian	English	Meaning here
Jastip / jasa titip	Personal shopping service	Buying abroad on request
Tripper	Traveller	The person who travels and buys
DP (uang muka)	Deposit	Partial payment that confirms an order
Pelunasan	Settlement	The final payment
Resi	Tracking number	Courier tracking reference
Ongkir	Shipping fee	Delivery charge
HPP	COGS	Cost of goods sold
Omzet	Revenue	Gross sales
Laba kotor	Gross profit	Revenue minus cost of goods
Laba bersih	Net profit	Gross profit minus expenses
Piutang	Receivables	Money customers owe you
Kurs	Exchange rate	Foreign currency to rupiah
Markup	Markup	Amount added to cost to set the price
Stok	Stock	Goods on hand with no owner
Kuota	Quota	Maximum units offered on a trip
